Race Chip

Your RaceChip Service-Card

If you have any questions concerning the installation, our RaceChip-Team is gladly available for you.

The installation of RaceChip plus the correct commissioning is designed so you can do all the installation steps yourself without technical know-how.

The nice thing about RaceChip is that even if you install it the wrong way, there normally can't accrue an adversity. All of the vehicles we suggest run without any mistake. If you should see a pilot lamp or the driving conditions appear to be a bit worse after the installation you are definitely at the wrong connector. In that case please ensure one more time if you really connected RaceChip at the Common-Rail clip, because there are similar and as well applicable clips in the motor bay.

Have fun with your RaceChip!

At application per phone please keep ready:

Your invoice number:

Your postcode:

So we can find your order quickly please insert your invoice number and your postcode in the area above. This postcard is perfect in transit. You accomplish our service +49 (0) 7023 / 743327 - 0

Reconsignment or exchange under the warranty?

Please contact our service before. Most of the time we can clarify technical questions via phone. We gladly help you. If you still want to sent your parcel back please use this reconsignment form for a quick adaptation:

RaceChip

The fine adjustment of your RaceChip

Over the contactors on the blank you have the possibility to adjust the power of RaceChip individually.

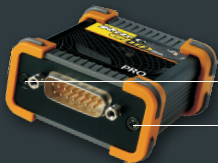

The condition of RaceChip as supplied to customer is one of us recommended mixture of "increased efficiency, torque raise and as well possible fuel savings".

Only put one level further and make an extensive test drive afterwards.

Condition as supplied to customer:

Turn-switch 1: B | turn-switch 2: 1

At vehicles with 12V access: Left B | right B

Here open

Turn-switch 1

Adjustments for desired torque raise and increased efficiency. If there appears to be an alarm message in the cockpit when you press the gas pedal when pushing on, adjust one level back. An alarm message is a good thing because your engine is telling you in that way that the chosen power of RaceChip is too strong (engine protection system).

Turn-switch 2

Adjustment of desired "tuning switch-off point". If there appears to be an alarm message in the cockpit at highest speed (e.g. when driving on the highway) adjust one level back.
